PRESENTATION SCRIPT

SchoolHub

Enrollment and School Management System

Lyceum of the East Aurora Inc.

Presented by	**Shella Erika Gomez** **Juvirena P. Pascual** **Chunlie L. Martinez** **Kyla J. Verial** **Carlo Jay I. Villaflor** **John Carmel M. Galande**
Course / Year	**Accountancy, 2nd Year**
Date	**October 16, 2026**
Slides	**14, in SchoolHub-Presentation.pptx**
Talk	**15 minutes, then about 5 minutes of questions**

Inside: the timing plan, the word-for-word talk for each slide, a 5-minute live demo with a backup plan, a Q&A cheat sheet, a one-page fact sheet, and a checklist for the day. The same words are in each slide's speaker notes.

How to use this script

The talk is about **1,535 words**, which is roughly 12 minutes at a calm speaking pace. The rest of the 15 minutes is for pausing, pointing at the screen, and moving between slides. Read it aloud twice before the day, and put the talk in your own words where that feels natural. The words on the slide are headlines; the script is what you say.

#	Slide	Minutes	Start at
1	SchoolHub	0:45	0:00
2	Today, school work lives on paper and spreadsheets	1:00	0:45
3	One system for the whole school office	1:00	1:45
4	One student's journey, from application to enrolled	1:15	2:45
5	Five roles, each with its own portal	1:00	4:00
6	Walk-in enrollment, done in one pass	1:15	5:00
7	The cashier sees the whole account at the window	1:30	6:15
8	The school's books, computed, not retyped	1:15	7:45
9	An e-ID anyone can verify by scanning	1:00	9:00
10	Security and privacy are built in	1:15	10:00
11	Built and tested like a real system	1:00	11:15
12	Running today, and what it costs to launch	1:00	12:15
13	Honest limits, and the next steps	1:15	13:15
14	Thank you	0:30	14:30
	Total	**15:00**	

Tips

- Six members, one story. Agree who speaks which slides (a suggested order is below) and practise the hand-overs.
- Look at the panel, not the screen. The slides are for them; you already know what is on them.
- Slow down on the numbers: 399 tests, 2,703 checks, and the cost range.
- If you run long, shorten slides 5 and 11. If you run short, add one example on slides 6 or 7.
- Maria Santos is a made-up demo student. Say so if asked, and never show real student records.

- On slide 12, say the prices are estimates. On slide 13, do not skip the limits: panels trust a speaker who names them.

Click means move to the next slide. Words in square brackets are for you to fill in.

Suggested speaking order

A suggestion, to change as you like. Each member speaks about two and a half minutes, so everyone is on for a similar time. The last member also closes and invites questions.

Member	Slides	From	To
Shella Erika Gomez	1 to 2: SchoolHub; Today, school work lives on paper and spreadsheets	0:00	1:45
Juvirena P. Pascual	3 to 4: One system for the whole school office; One student's journey, from application to enrolled	1:45	4:00
Chunlie L. Martinez	5 to 6: Five roles, each with its own portal; Walk-in enrollment, done in one pass	4:00	6:15
Kyla J. Verial	7 to 8: The cashier sees the whole account at the window; The school's books, computed, not retyped	6:15	9:00
Carlo Jay I. Villaflor	9 to 10: An e-ID anyone can verify by scanning; Security and privacy are built in	9:00	11:15
John Carmel M. Galande	11 to 14: Built and tested like a real system; Running today, and what it costs to launch; Honest limits, and the next steps; Thank you	11:15	15:00

For the live demo, one member operates the screen and one speaks. Say "I" or "we" freely during the demo steps.

The talk, slide by slide

Slide 1 SchoolHub

0:00 – 0:45

On screen: Title slide: the system name, the school, and your name.

Good day, everyone. We are the SchoolHub team, and we are presenting SchoolHub, an enrollment and school management system built for Lyceum of the East Aurora Inc.

In the next fifteen minutes we will show you what it does, how it keeps records safe, and what it would take to use it at the school. We will follow one student, Maria, through the whole process, so you can see how the pieces fit together.

Please keep your questions for the end. We will also be glad to show the system live.

Our team members are Shella Erika Gomez, Juvirena P. Pascual, Chunlie L. Martinez, Kyla J. Verial, Carlo Jay I. Villaflor, and John Carmel M. Galande.

Click

Slide 2 Today, school work lives on paper and spreadsheets

0:45 – 1:45

On screen: Three problems: slow, error-prone, and hard to check.

Let us start with the problem. Today, a lot of school office work depends on counters, paper, and spreadsheets. Think of enrollment week. A student enrolls at one window, pays at another, and the cashier writes the payment into an Excel ledger. The registrar keeps the requirements in folders.

That causes three problems. First, it is slow: students line up, and staff type the same information again and again. Second, it is easy to make mistakes, like a wrong amount, a missing document, or a payment recorded in the wrong account. Third, it is hard to check. When someone asks who approved this, or whether an ID is real, the answer is buried in paper.

SchoolHub is built to fix those three things, one by one.

Click

Slide 3 One system for the whole school office

1:45 – 2:45

On screen: The public landing page, with four short points.

So what is SchoolHub? It is one web system for the whole school office. This is its front page, the one the public sees. Students can apply online, upload their documents, pay, and see their schedule and grades.

Staff work in the same system, but each from a portal with only the tools they need. It also serves walk-in students, because not everyone has a phone or internet at home, and the counter must keep working.

Nothing special is needed to use it. It runs in a browser, on a computer or a phone, so there is nothing to install.

Click

Slide 4 One student's journey, from application to enrolled

2:45 – 4:00

On screen: Six steps from Apply to Enrolled.

Here is the journey, using Maria as our example. Maria applies, online or at the counter. The registrar checks her documents, and either approves, or sends the application back with a reason she can read.

When it is approved, Maria gets a section, and her fee assessment is created automatically from the school's fee schedule, so nobody computes it by hand. She pays, online with proof or at the cashier, and the cashier issues an official receipt.

When the payment policy is met, Maria is officially enrolled and receives a student number. The important part is the line at the bottom of the slide: every step records who did it and when, so nothing depends on memory.

Click

Slide 5 Five roles, each with its own portal

4:00 – 5:00

On screen: Student, Teacher, Registrar, Cashier, Administrator, with what each one does.

There are five kinds of users, and each has a separate portal. Students apply, pay, and view their records. Teachers record attendance and grades for their own classes.

The registrar handles enrollment, sections, the curriculum, and academic records. The cashier handles fees, payments, receipts, and the books. The administrator manages accounts, settings, backups, and the audit log.

The key idea is that nobody sees more than their job needs. A teacher cannot open payments, and a cashier cannot change grades. That protects the students, and it also protects the staff.

Click

Slide 6 Walk-in enrollment, done in one pass

5:00 – 6:15

On screen: The registrar's documents step for a walk-in applicant.

Let us show the counter. Walk-in enrollment was built for the registrar. The registrar enters the applicant once, and the form checks everything in a single pass. It shows every missing field at the same time, instead of one mistake per click, which is what used to waste the most time.

It also warns if the person is already registered, and returning students are found by name or number, so no second account is made. Then the registrar ticks the documents received in person, can take the applicant's photo, and submits. The application goes straight to review, because the registrar already saw the originals.

And the student receives a one-time link to choose their own password. No password is ever shared or written down.

Click

Slide 7 The cashier sees the whole account at the window

6:15 – 7:45

On screen: Walk-in payments: the installment table, and where each peso went.

Now Maria goes to the cashier. The cashier's window shows everything on one screen: the installments, which are the initial payment, prelims, midterm, semi-final, and finals, and underneath, where each peso went. Quick buttons fill in the amount, either the next installment or the full balance, so the cashier does not type it.

Every payment gets a numbered official receipt, and a reprint is marked as a duplicate. Mistakes are never deleted. A payment is reversed with a written reason, and the reversal is recorded beside the original, so the history stays honest.

At the end of the day, the cashier counts the drawer, the system shows any difference, and the day is closed and locked. The cashier can also send a reminder to students who are due, and it appears in their portal.

Click

Slide 8 The school's books, computed, not retyped

7:45 – 9:00

On screen: The two-sided cash book, and the payment breakdown.

Maria's payment is already in the cashier's books. This part was modeled on the school's own Excel ledger. The general ledger and the trial balance are computed from the real records, so they always agree with the receipts and vouchers. There is nothing to retype.

The cash book uses the two-sided format the office already knows: cash in on the left, cash out on the right, with the balance carried forward. Opening balances and bank deposits are entered once, and you can see Maria's two cash payments on the left.

The payment breakdown report shows how much went to tuition, registration, and each other fee, by payment method and by day. Because the totals come from the same records, they cannot drift apart.

Click

Slide 9 An e-ID anyone can verify by scanning

9:00 – 10:00

On screen: The e-ID card, and the page a scan opens.

Now that Maria is enrolled, she can have an e-ID with a QR code. On the left is the card, front and back. When a guard or an office scans the code with a phone, the school's website opens, as you see on the right, and says Valid or Not valid, with the photo, name, ID number, and program. Nothing else. No birthday, no address, no grades.

The code is a long random string, not the student number, so IDs cannot be guessed. If a card is lost, the registrar reissues it, and the old QR stops working immediately.

Click

Slide 10 Security and privacy are built in

10:00 – 11:15

On screen: Six protections.

The panel will care about security, so let us be specific. Access is by role and permission, and it is checked on every page, not only hidden in the menu. Passwords are stored hashed, accounts lock after repeated failures, and sessions expire when idle.

Uploaded files are stored privately and only shown to people who are allowed to see them. Every important action is written to an audit log that cannot be edited. Forms are protected against forged requests, and the system is tested against injection attacks.

For data privacy under RA 10173, the system records consent, collects only what it needs, and the public verification page shows the minimum.

Click

Slide 11 Built and tested like a real system

11:15 – 12:15

On screen: Five numbers: 399 tests, 2,703 page checks, 30 documents, 37 database updates, 0 outside libraries.

How do we know it works? We treated this like a real system. Every feature is written in the documentation first, 30 documents in all, and then built.

There are 399 automated tests, plus a crawler that opens every page as every role, 2,703 checks, including attacks such as forged forms and injection attempts. The system uses no outside software libraries that could go out of date or be abandoned.

Updates reach the live site by a tested routine: back up, run the database script, upload the files. We test that script on a copy first, so the live records are never the first place a change is tried.

Click

Slide 12 Running today, and what it costs to launch

12:15 – 13:15

On screen: The live pilot, and an estimate of the yearly cost.

SchoolHub is already running on a free hosting service as a pilot, and it works from enrollment to payment.

For real use, the cost is small. A domain name is about 700 to 1,200 pesos a year. Good shared hosting, with backups and scheduled jobs, is about 1,800 to 5,000 pesos a year. Email can be free or cost up to 1,500. So the total is roughly 3,000 to 8,000 pesos a year. These figures are estimates and should be confirmed before buying.

Compare that with the staff time spent on manual entry, and with the risk of mistakes in money records. There is also no per-student license fee, and the school owns the system.

Click

Slide 13 Honest limits, and the next steps

13:15 – 14:30

On screen: Four limits on the left, five next steps on the right.

We want to be honest about the limits, because you should know them before deciding. Email is switched off on the pilot, so password links are handed over directly instead of emailed. Walk-in students are not affected, but password help goes through the administrator.

The free hosting is fine for a pilot, but not for real student records, so the next step is proper hosting, preferably with the data kept in the Philippines. The fee amounts for programs other than Public Administration still need to be entered. The e-signature is an image of a signature, not a legal digital signature. And the system is for one school.

The next steps are on the right: set up email, move to paid hosting, load every fee schedule, train the registrar and the cashier, and run one term as a supervised pilot.

Click

Slide 14 Thank you

14:30 – 15:00

On screen: Thank you and Questions, with your name.

Thank you for your time. SchoolHub is built to make enrollment faster, payments clearer, and records easier to trust.

We are happy to answer your questions, and we can show the system live.

Stop and invite questions

Live demo: five minutes

Use this after slide 9 if the panel wants to see the system, or after the questions. Use the demo accounts and a **made-up applicant** only. Sign in to the registrar and cashier accounts in two browser tabs before you start.

#	Say	Do	You should see
1	First, a student comes to the counter. I am the registrar. I open Walk-in registration and press the button without typing anything.	Log in as the registrar. Open Walk-in registration. Press "Create account and draft" with the form empty.	Every missing field is flagged at once, including the guardian fields.
2	Now I fill in the form for one student. If the person is already registered, the system tells me.	Fill the form for a new made-up applicant. Pick BSA, First Year (it has a section). Submit.	The one-time set-up link page appears. Refreshing it explains the link is shown once.
3	The documents are handed over at the counter. I tick them, take the photo, and submit. It goes straight to review.	Tick the four required documents, attach the photo, press Submit application, and confirm.	The application opens "Under review" with the Approve panel ready.
4	I choose the section and approve. The fee assessment is created automatically.	Choose the section and press Approve application, then confirm.	A message says the fee assessment was issued.
5	Now I am the cashier. I search the student, and the whole account is on one screen.	Log in as the cashier. Open Walk-in Payments, search the student, and open the account.	The installment table and "Where the payments went" are at the top.
6	I use the quick button for the amount, and record the payment. A numbered official receipt is issued.	Press the "Required to enroll" button, then Record and issue receipt, and confirm. Open the receipt.	The student is now officially enrolled and has a student number.
7	The same payment is already in the cashier's books. This is the cash book, in the format the office knows.	Open Reports, then Cash Book. Then Payment Breakdown.	The receipt appears under Cash Inflow; the breakdown shows the fee lines.
8	Last, the e-ID. I open the student's e-ID, and scan the QR with my phone.	Open the student's e-ID page. Scan the QR code on the back with a phone.	The school website opens and shows Valid ID with the photo, name, and program only.

If something goes wrong

- If the live site is slow or offline, switch to the slides and say: "We will show the same steps from screenshots."
- Slides 6 to 9 contain the screenshots for the demo steps, in the same order.
- Keep the phone charged and the QR card open on a second screen, in case the projector is not readable.
- Have a made-up applicant's details ready on paper so you are not typing from memory.

Questions the panel may ask

Short, honest answers. If you do not know, say so and offer to find out. Do not guess about law or prices.

Who can see student information?

Only people whose role needs it, and the check is made on every page, not only in the menu. A teacher sees their own classes, a cashier sees accounts and payments, the registrar sees records and enrollment. Every sensitive action is written to an audit log.

How does this follow the Data Privacy Act (RA 10173)?

The system records each person's consent, collects only what enrollment needs, limits who can see it, keeps an audit trail, and shows the least possible on the public ID check. Before real use, we recommend the school's data protection officer reviews it and decides where the data is stored.

What happens if the internet is down?

SchoolHub is a web system, so it needs a connection, like any online service. The pages are light, and they work on a phone's mobile data. For a long outage the office falls back to the paper process, and records can be entered afterward.

What about backups?

The administrator can create and restore backups from the system. For real use we recommend a host that also makes daily automatic backups, and a regular copy kept away from the server.

Can a payment be edited or deleted?

No. A payment can only be reversed, with a written reason, and the reversal is recorded next to the original. This keeps the money records honest and easy to audit.

Can someone fake an ID?

The QR opens the school's own website, which says whether the ID is valid. A copied QR still shows the real owner's photo and name, so it does not match the person holding it. A lost card is reissued and the old code stops working at once.

Where do the fee amounts come from?

The cashier keeps a Fee Schedule by program and year level, including percentage discounts. The system builds each student's assessment from it. The amounts for programs other than Public Administration still need to be entered.

Why is email off, and does that matter?

The pilot runs on a free host without a mail service. Walk-in students are not affected, because the registrar hands them the set-up link. Password help goes through the administrator. Adding a mail service later turns on emailed links.

Who maintains it after the presentation?

It is documented first: 30 documents describe every rule. It has 399 automated tests, so a change that breaks something is caught. It uses no outside libraries, and it runs on ordinary hosting, so any PHP developer can continue it. We recommend the school names one person as the system owner.

Why not buy an existing system?

This one follows the school's own process and its own Excel ledger, it has no per-student license fee, and the school owns the code. An existing product could be cheaper to start but harder to fit to the way the office works.

How secure is it against hacking?

It uses the standard protections: roles checked on every page, hashed passwords with lockout, forms protected against forgery, files kept private, and tests that try injection and forged requests. No system is perfectly safe, so use HTTPS, strong administrator passwords, regular backups, and periodic review.

How many users can it handle?

It is designed for a school of this size. In our local tests the pages answer in well under a tenth of a second. Real speed depends on the hosting, which is one reason to move from the free host to a paid plan.

Can parents or guardians use it?

Not yet. Guardians are recorded as emergency contacts, and a parent portal is a sensible later step.

Does it work on phones?

Yes. The pages adjust to the screen, so students can use it on a phone. The e-ID is checked by simply scanning the QR with the phone camera.

What if the cashier closes the day by mistake?

A closed day locks. Only the administrator can reopen it, with a written reason, and the reopening is recorded in the audit log.

What does staff training involve?

The screens follow the task, such as Walk-in registration or Walk-in payments, and each role only sees its own menu. We expect a short session per role, then supervised use during the pilot term.

What did you test, and how?

There are 399 automated tests covering the business rules, and a crawler that opens every page as every role and also sends forged and malicious requests, 2,703 checks in all. Each database update is first tested on a copy.

What is the e-signature? Is it legal?

It is an image of the person's signature that prints above their name on documents they prepare. It is a convenience, not a cryptographic digital signature, and it does not replace a legally required signature.

One-page fact sheet

Topic	Fact
Roles	Student, Teacher, Registrar, Cashier, Administrator
Built with	PHP 8.2, MySQL, Tailwind CSS, plain JavaScript; no outside libraries
Automated tests	399 passing
Page and security checks	2,703 (every page, every role, forged and malicious requests)
Specification documents	30, written before the features
Database updates	37, each tested on a copy before going live
Enrollment	Online and walk-in; documents, review, approval with a section, assessment, payment, enrolled
Fees	By program and year; percentage discounts; installments by exam period
Money records	Official receipts, reversals, vouchers, general ledger, cash book, payment breakdown, day close
E-ID	Photo, name, ID number, QR; public check shows only photo, name, ID number, program
Security	Roles on every page, hashed passwords, lockout, audit log, private files, forgery protection, injection tests
Live pilot	Running on free hosting; email off
Estimated cost to launch	About PHP 3,000 to 8,000 per year (domain, hosting, email); confirm current prices

Before you present

- ☐ Open the live site and the demo accounts in separate browser tabs, and sign in before you start.
- ☐ Make sure the demo applicant is a made-up person with a unique email.
- ☐ Charge your phone and test scanning a QR code once.
- ☐ Save the slides as a PDF too, in case PowerPoint will not open.
- ☐ Bring this script printed, and the Q&A pages open.
- ☐ Check the projector shows the screenshots clearly.
