1 The whole system at a glance

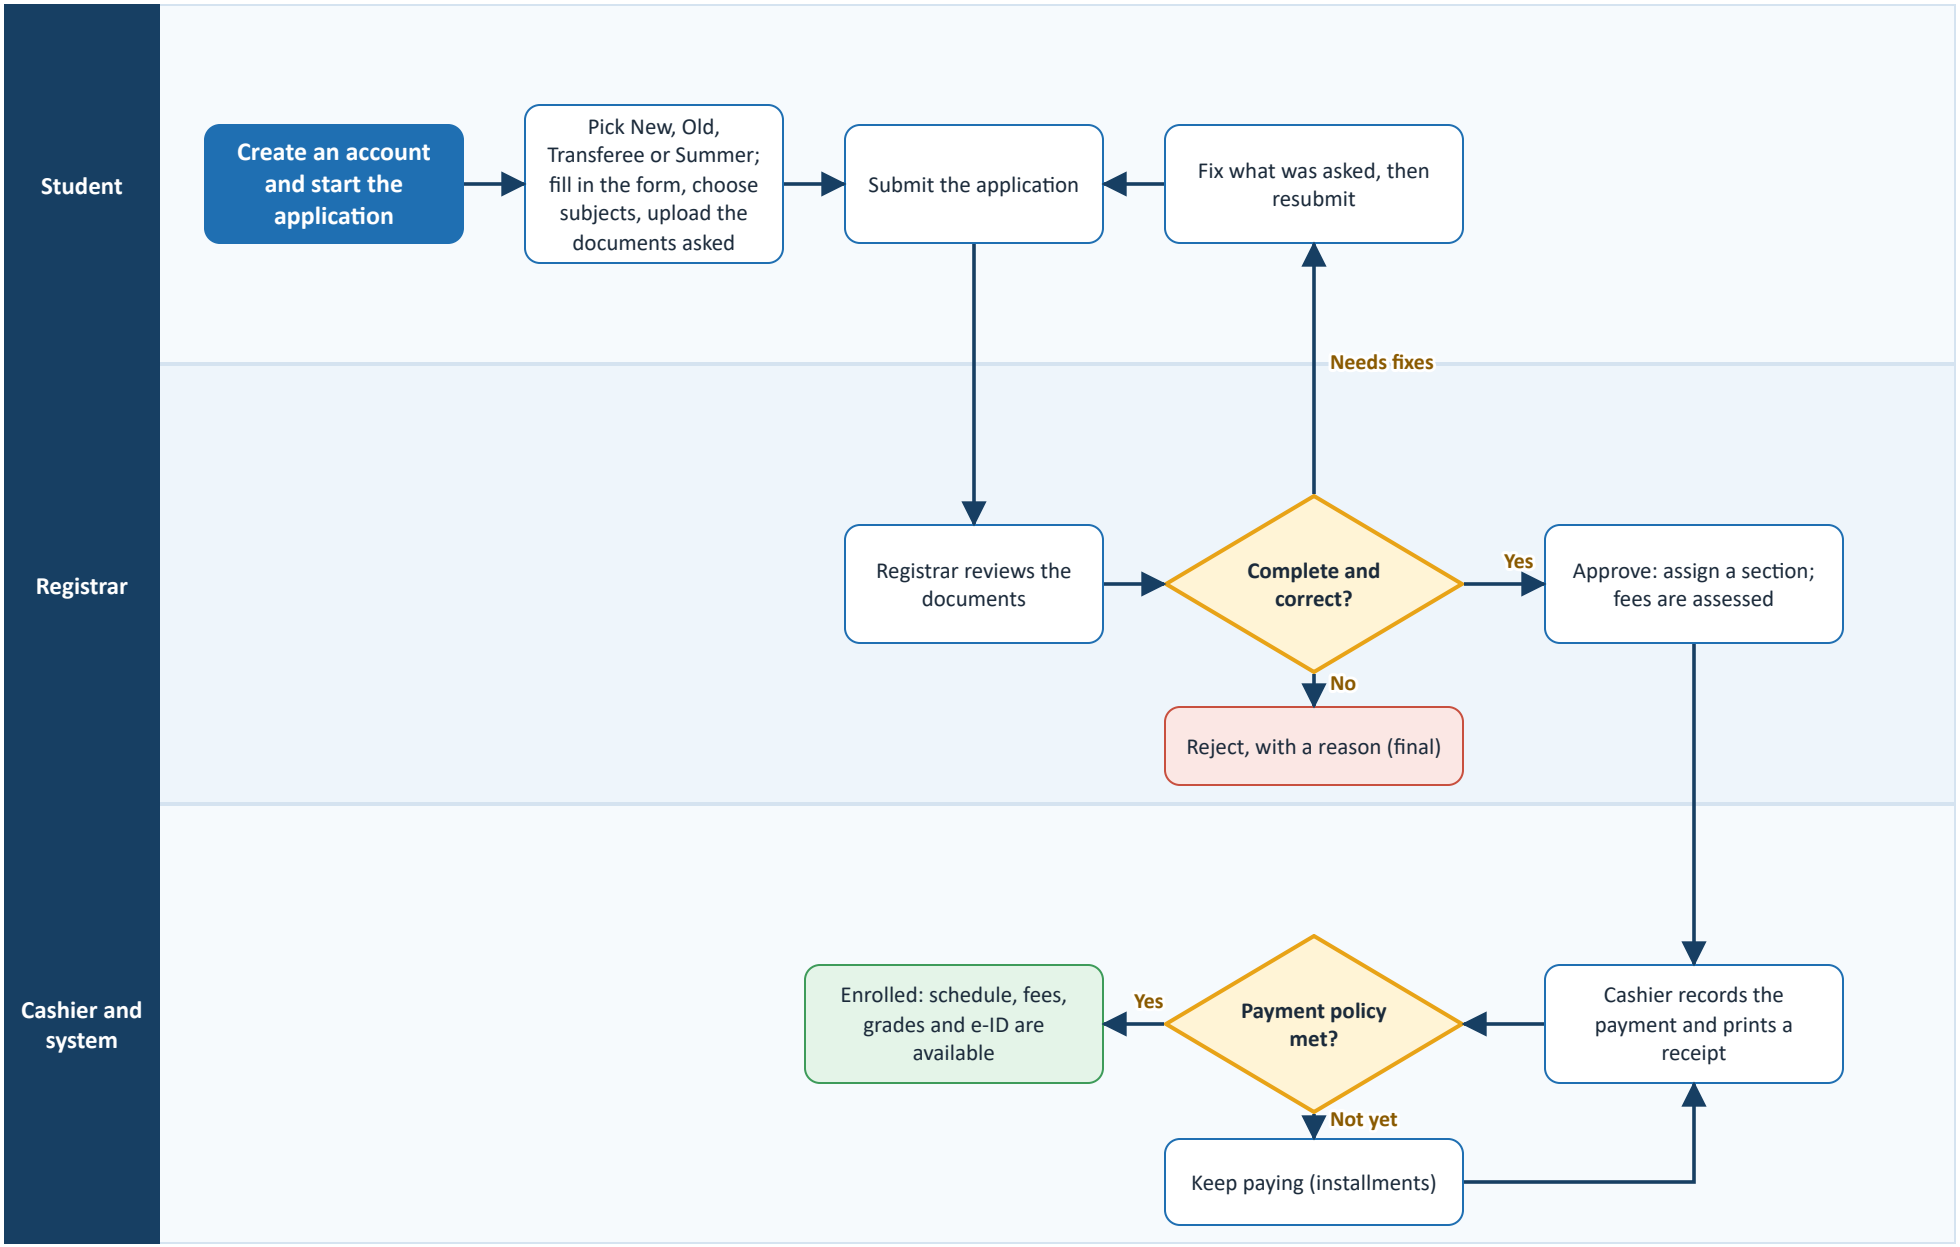

Who uses SchoolHub, and what each role does. Every action is checked, saved, and logged.

Shared by everyone: notifications and announcements · audit log of every important action · e-ID with QR verification · backups

2 One student's journey: from application to enrolled

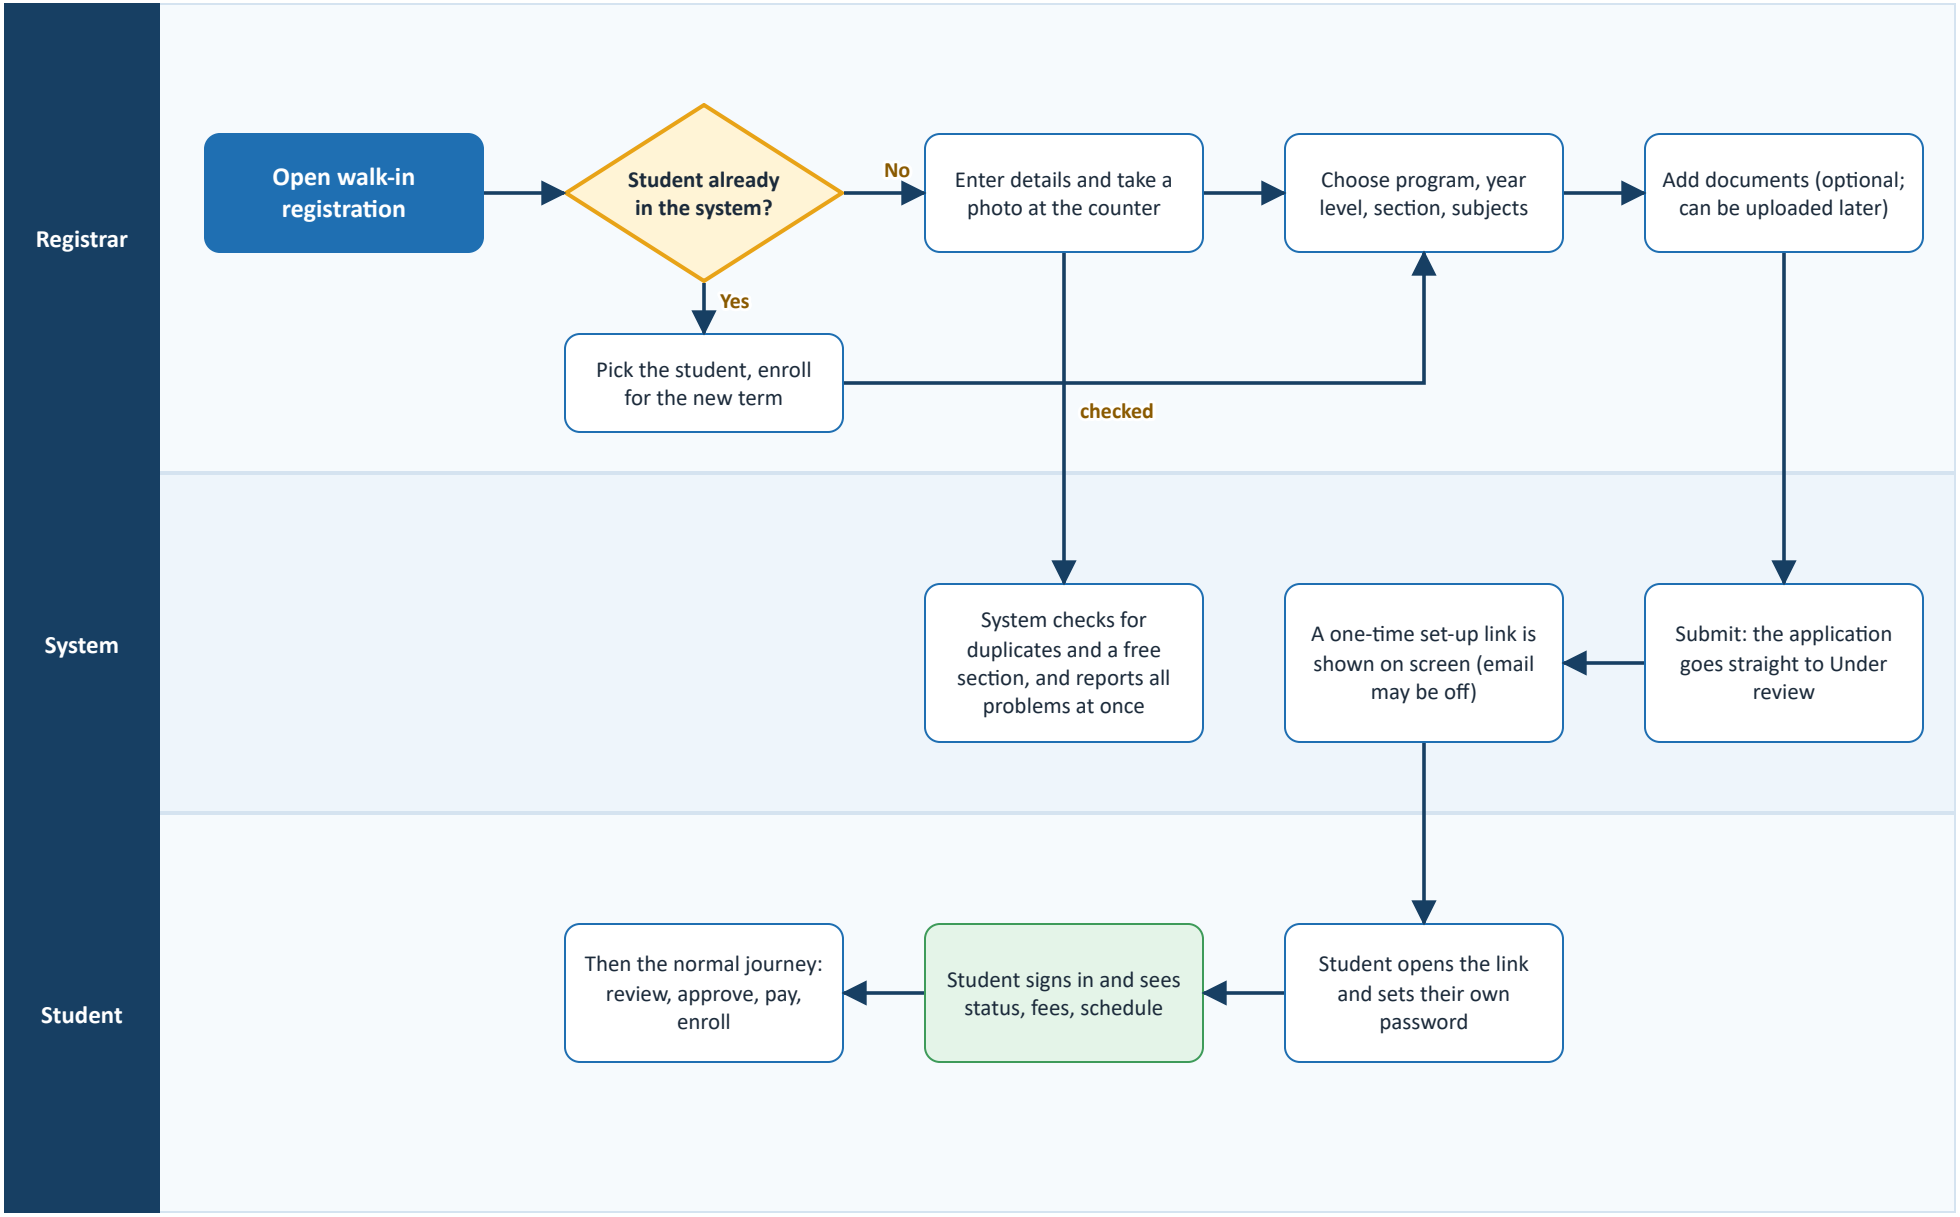

The registrar approves; the cashier takes the payment; the system moves the application along and records each step.

Behind the scenes: every status change is saved in a history, checked again on the server, and written to the audit log. The student is notified at each step. A student can also cancel before approval.

3 Walk-in enrollment, done in one pass

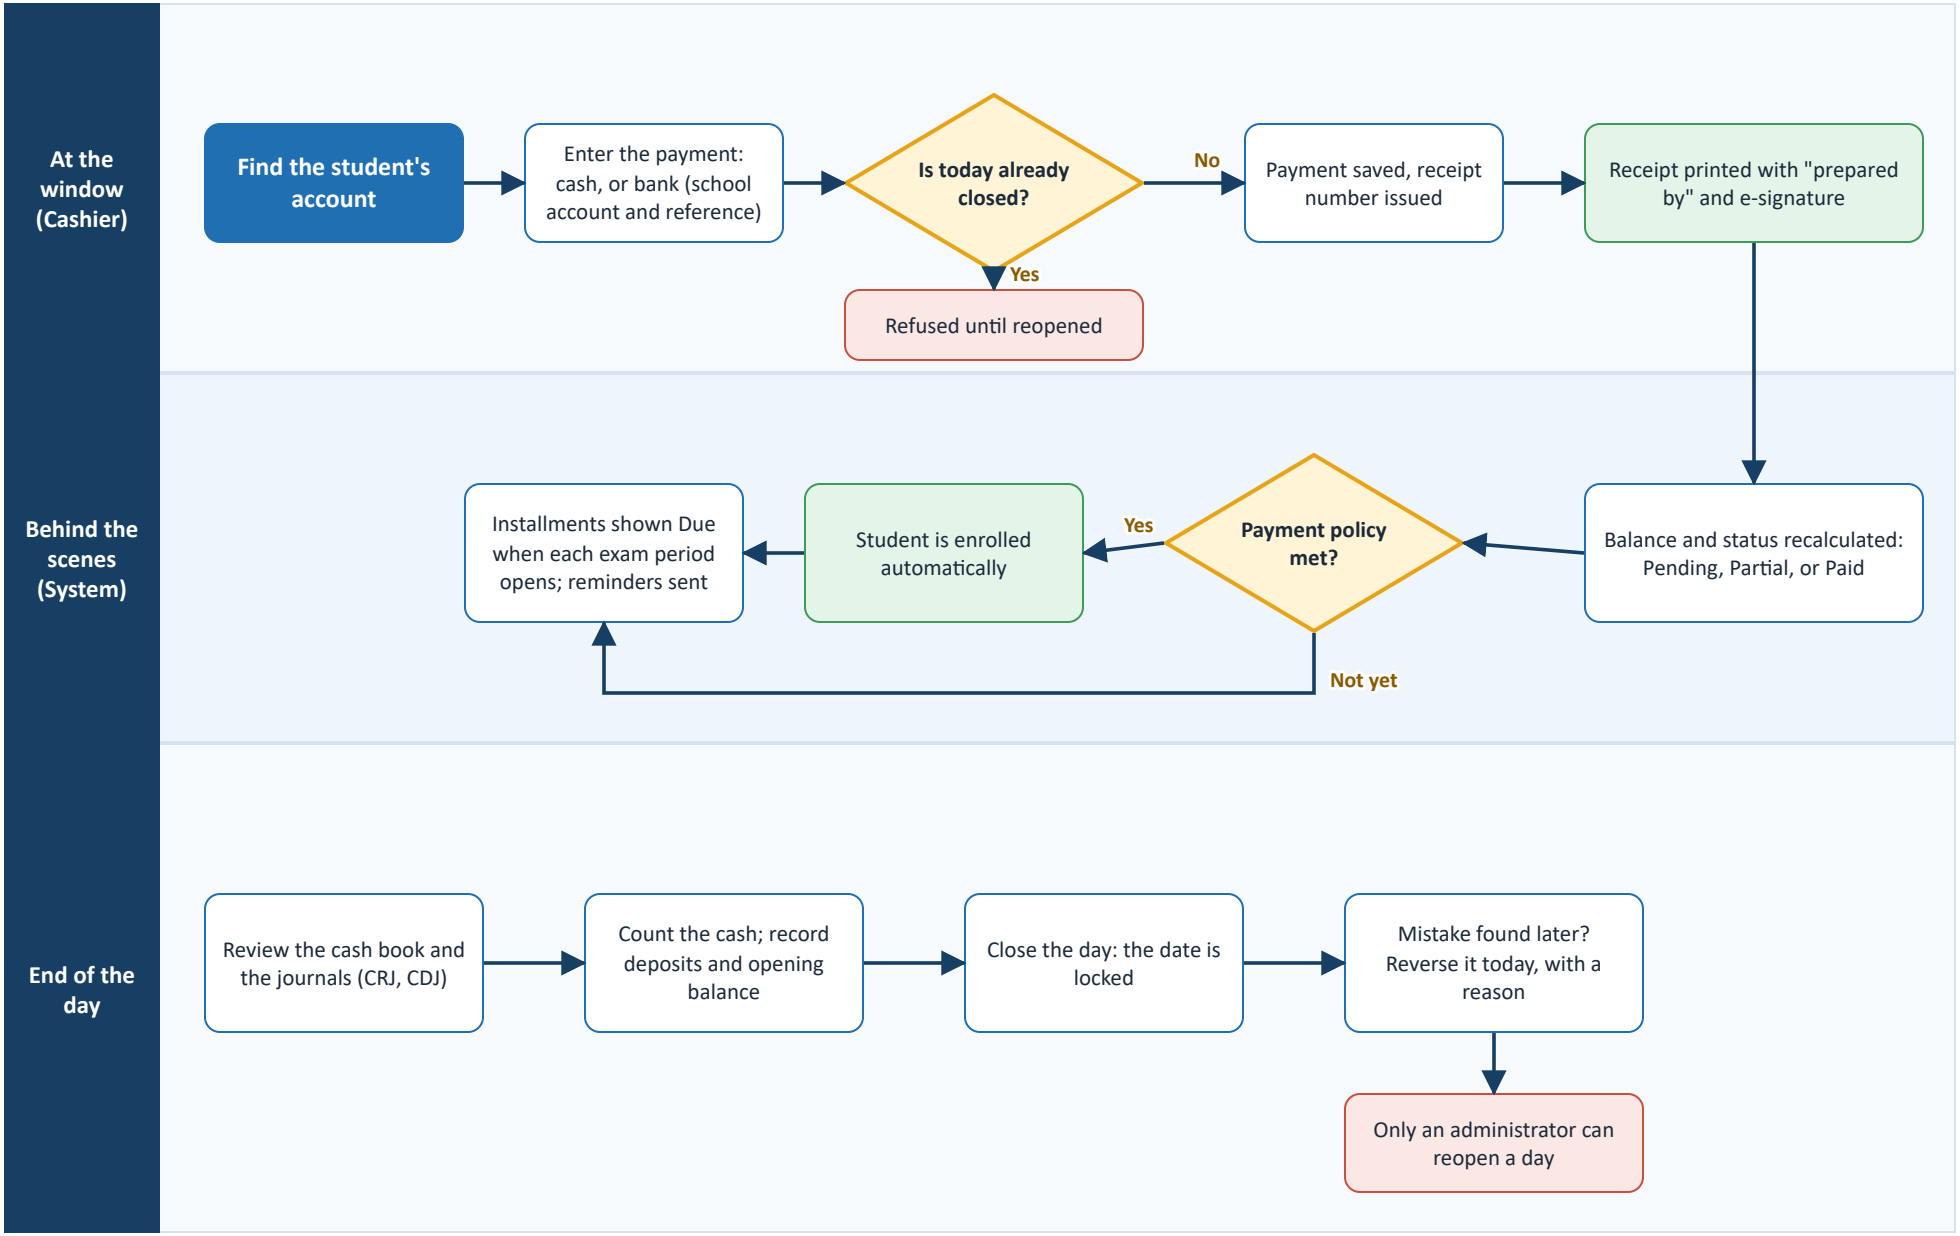

The registrar enrolls a student at the counter. Documents are optional and can come later.

Two ways in: the Walk-in enrollment button on the dashboard, or Enroll for a term on a student's record (that student is already chosen). **With email off:** the set-up link appears on its own page for the registrar to hand over.

4 Payments, receipts, and closing the day

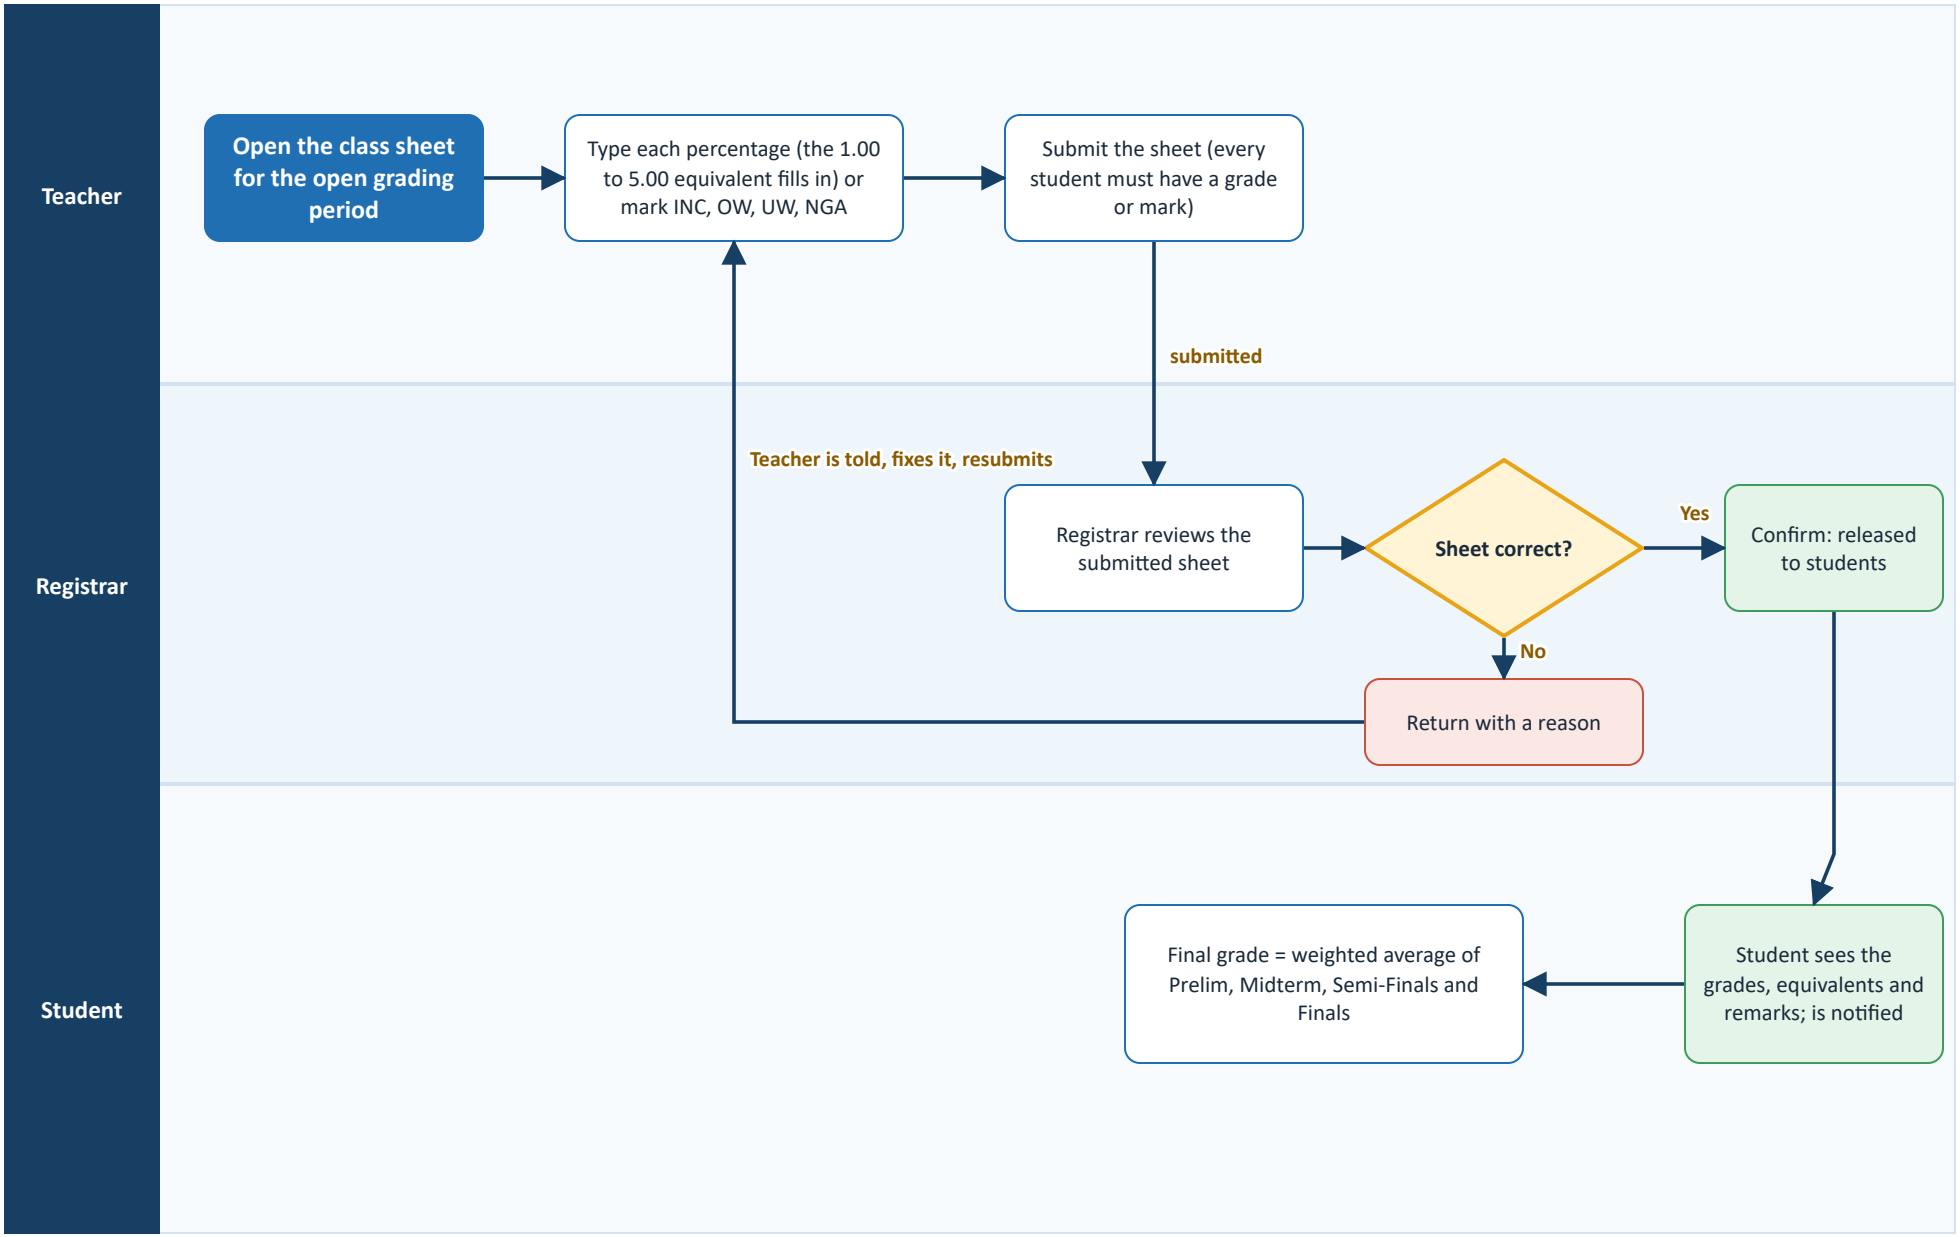

The cashier takes the money; the system keeps the balances; the day is locked once the cash is counted.

Money is whole centavos, never deleted: a payment is reversed with a new entry, not erased. The old account is paid first; the rest is split in proportion across the fee lines.

5 Grades: entered by the teacher, confirmed by the registrar

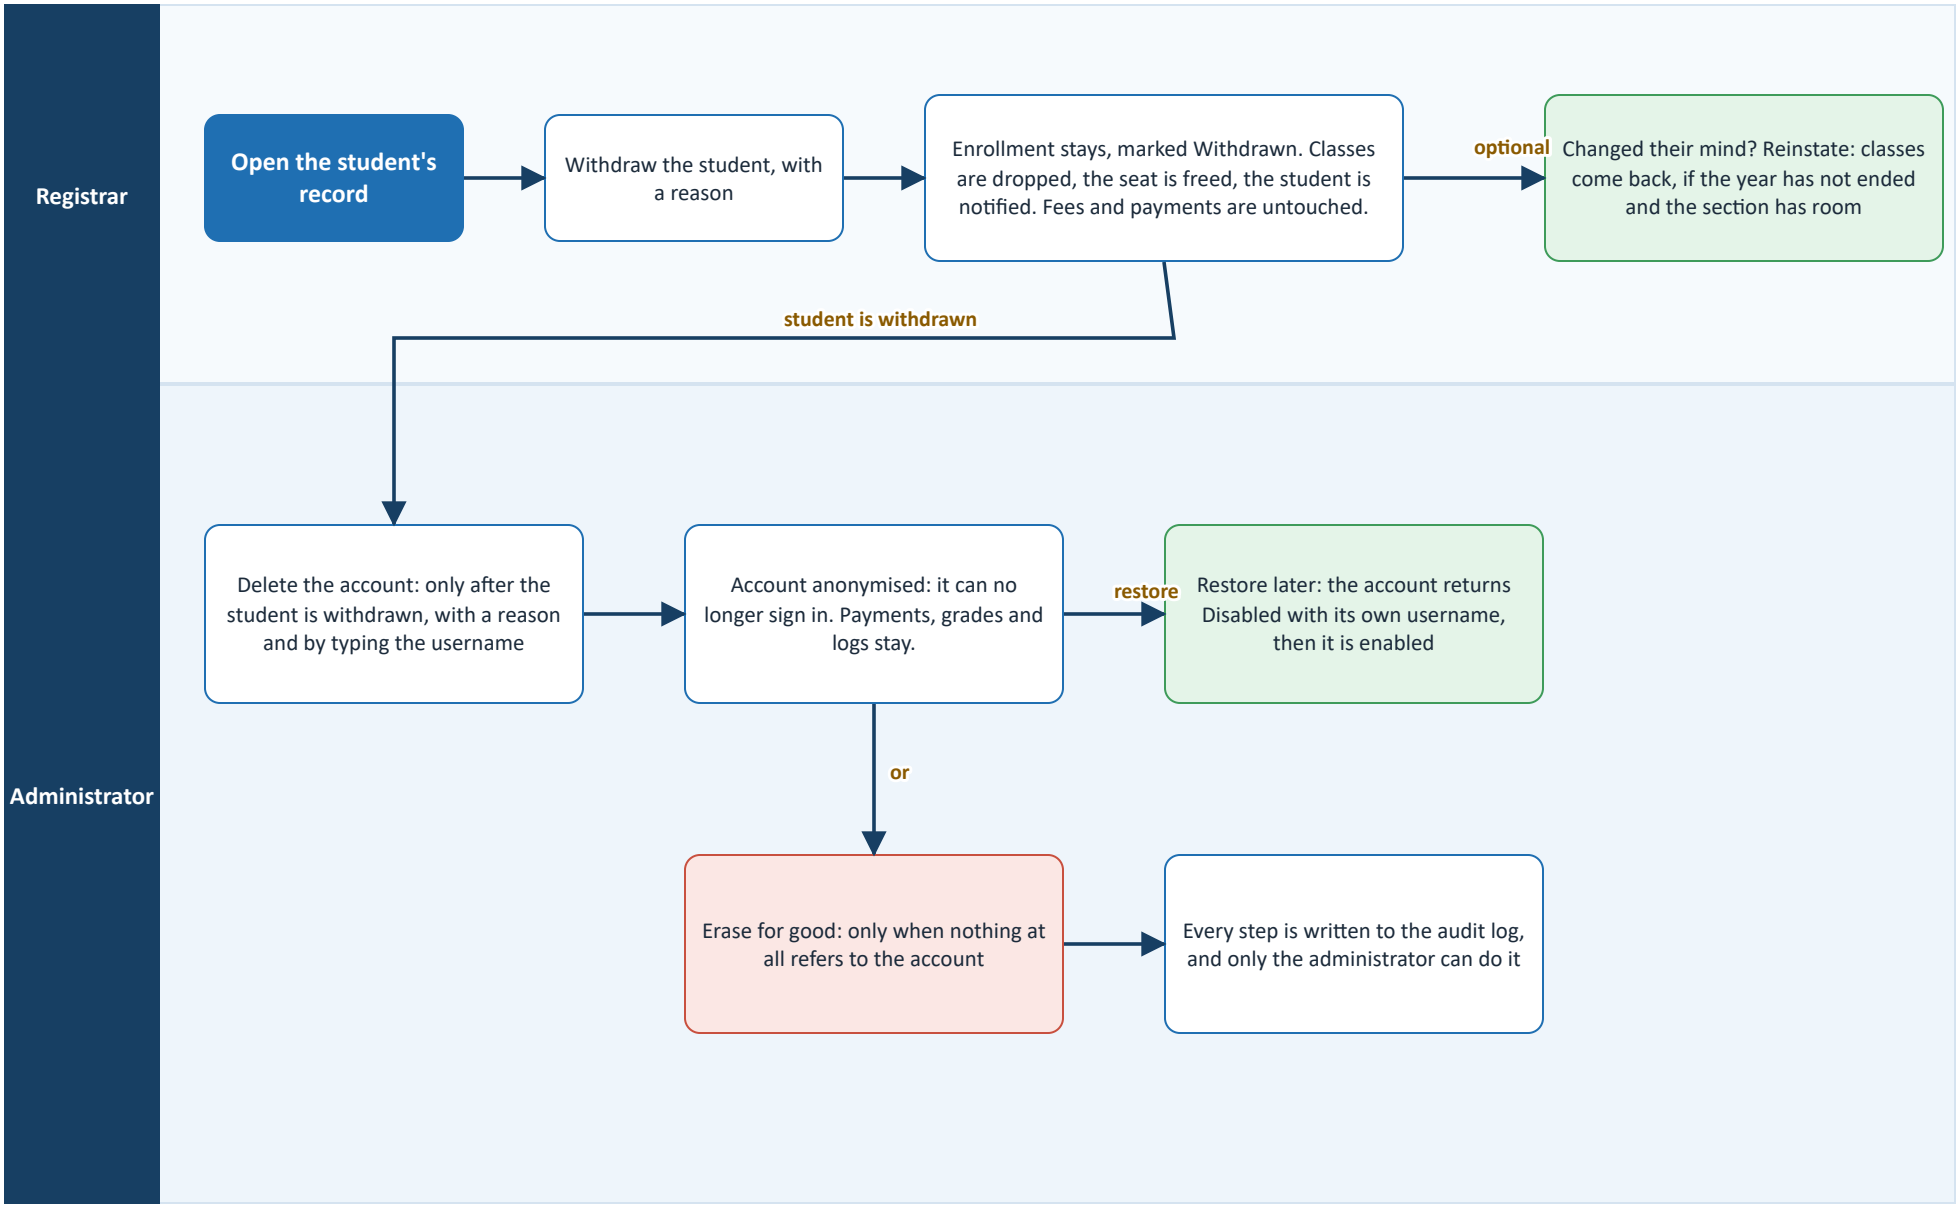

Students see a grade only after the registrar confirms it, so a draft or a mistake is never seen.

A sheet moves: Draft → Submitted → Confirmed (or Returned). A submitted or confirmed sheet is locked for the teacher; the registrar can send even a confirmed sheet back, and students stop seeing it. Every step is audited.

6 Withdrawing a student, and deleting an account

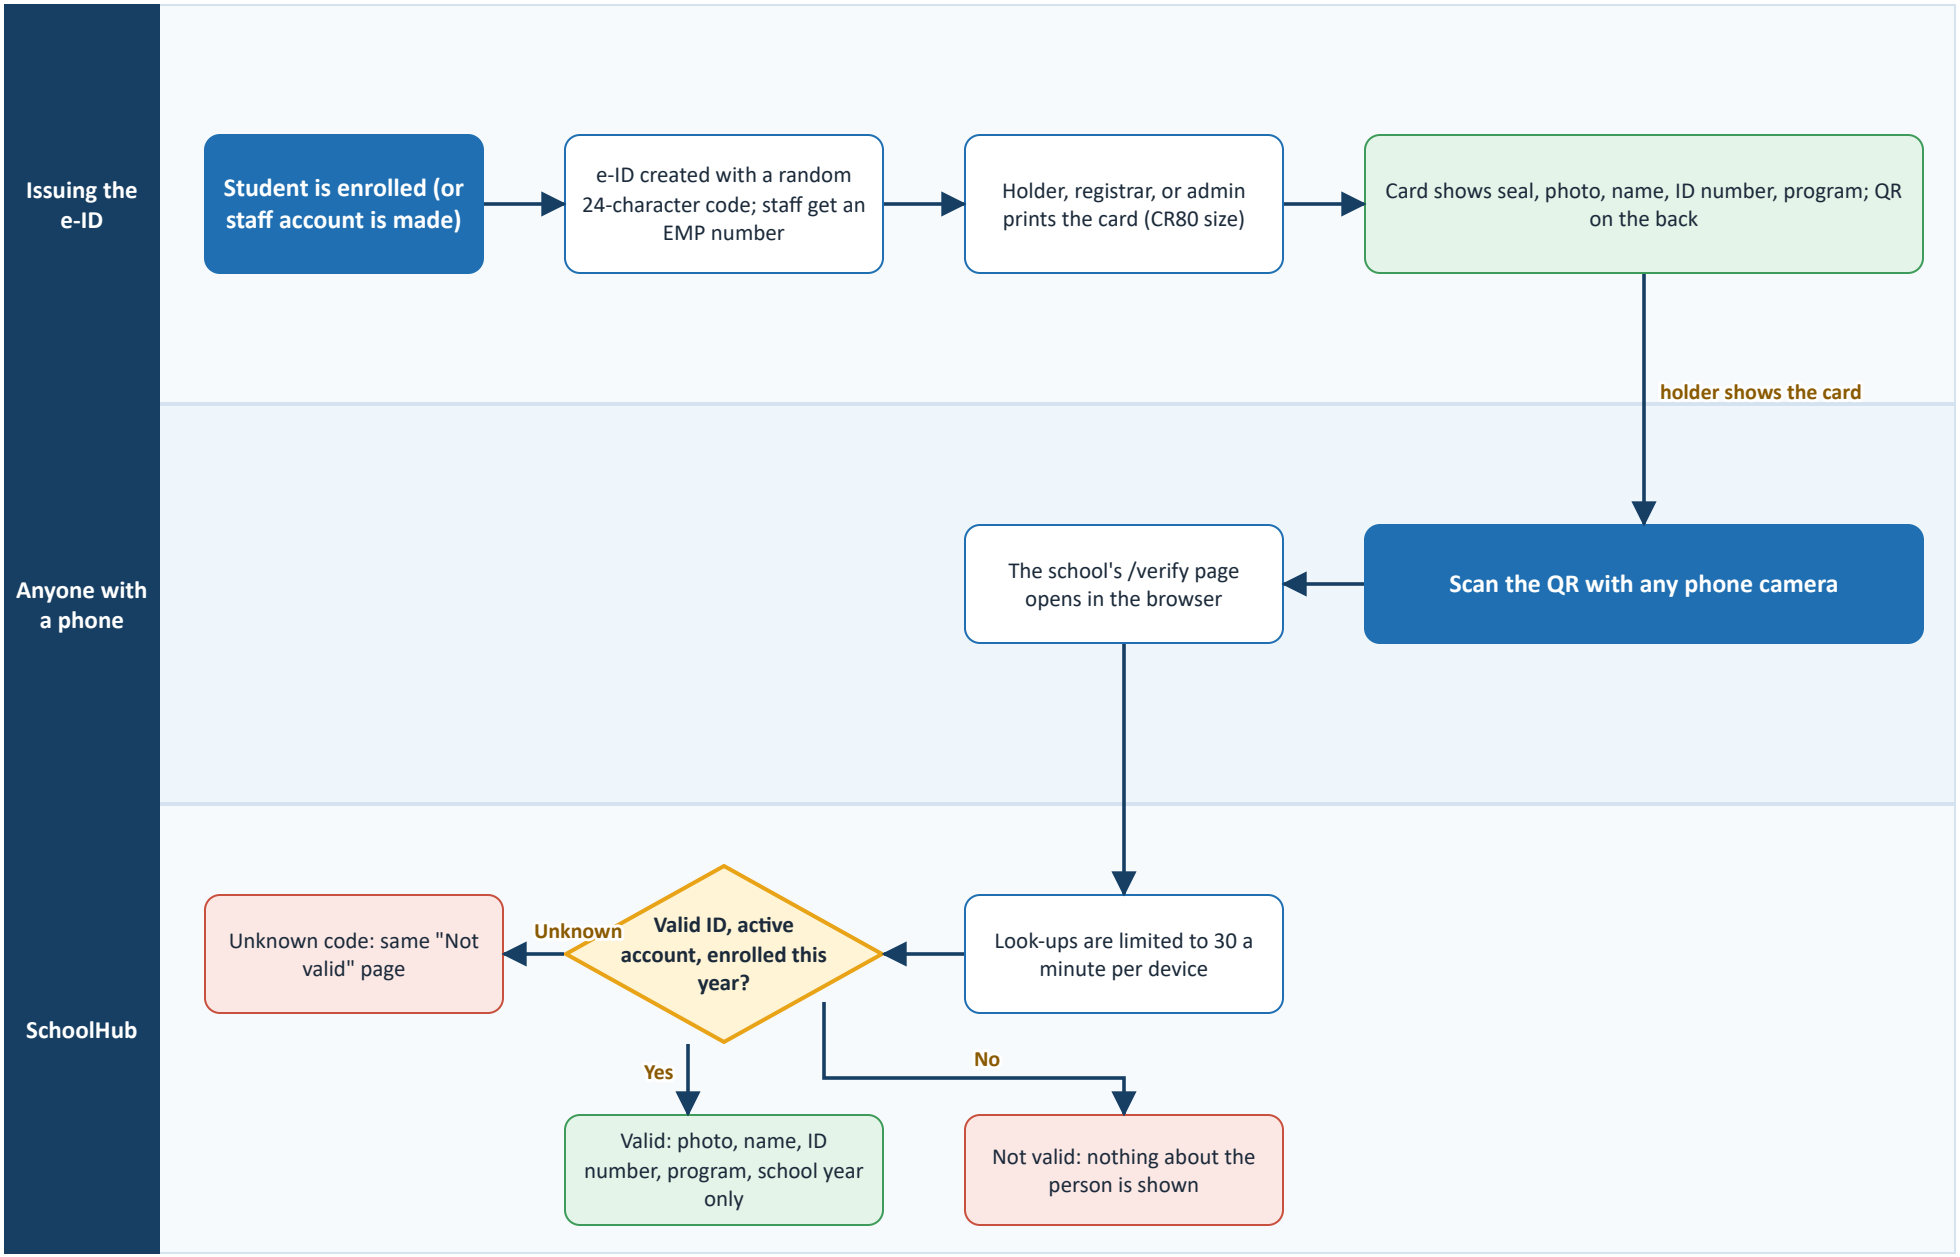

Nothing about a student's money or grades is ever lost: withdrawal keeps the record, and deletion only locks the account.

Why two steps: withdrawing is the registrar's decision about enrollment; deleting is the administrator's decision about the login. An account with payments or grades is anonymised, not erased.

7 The e-ID, and how anyone can verify it by scanning

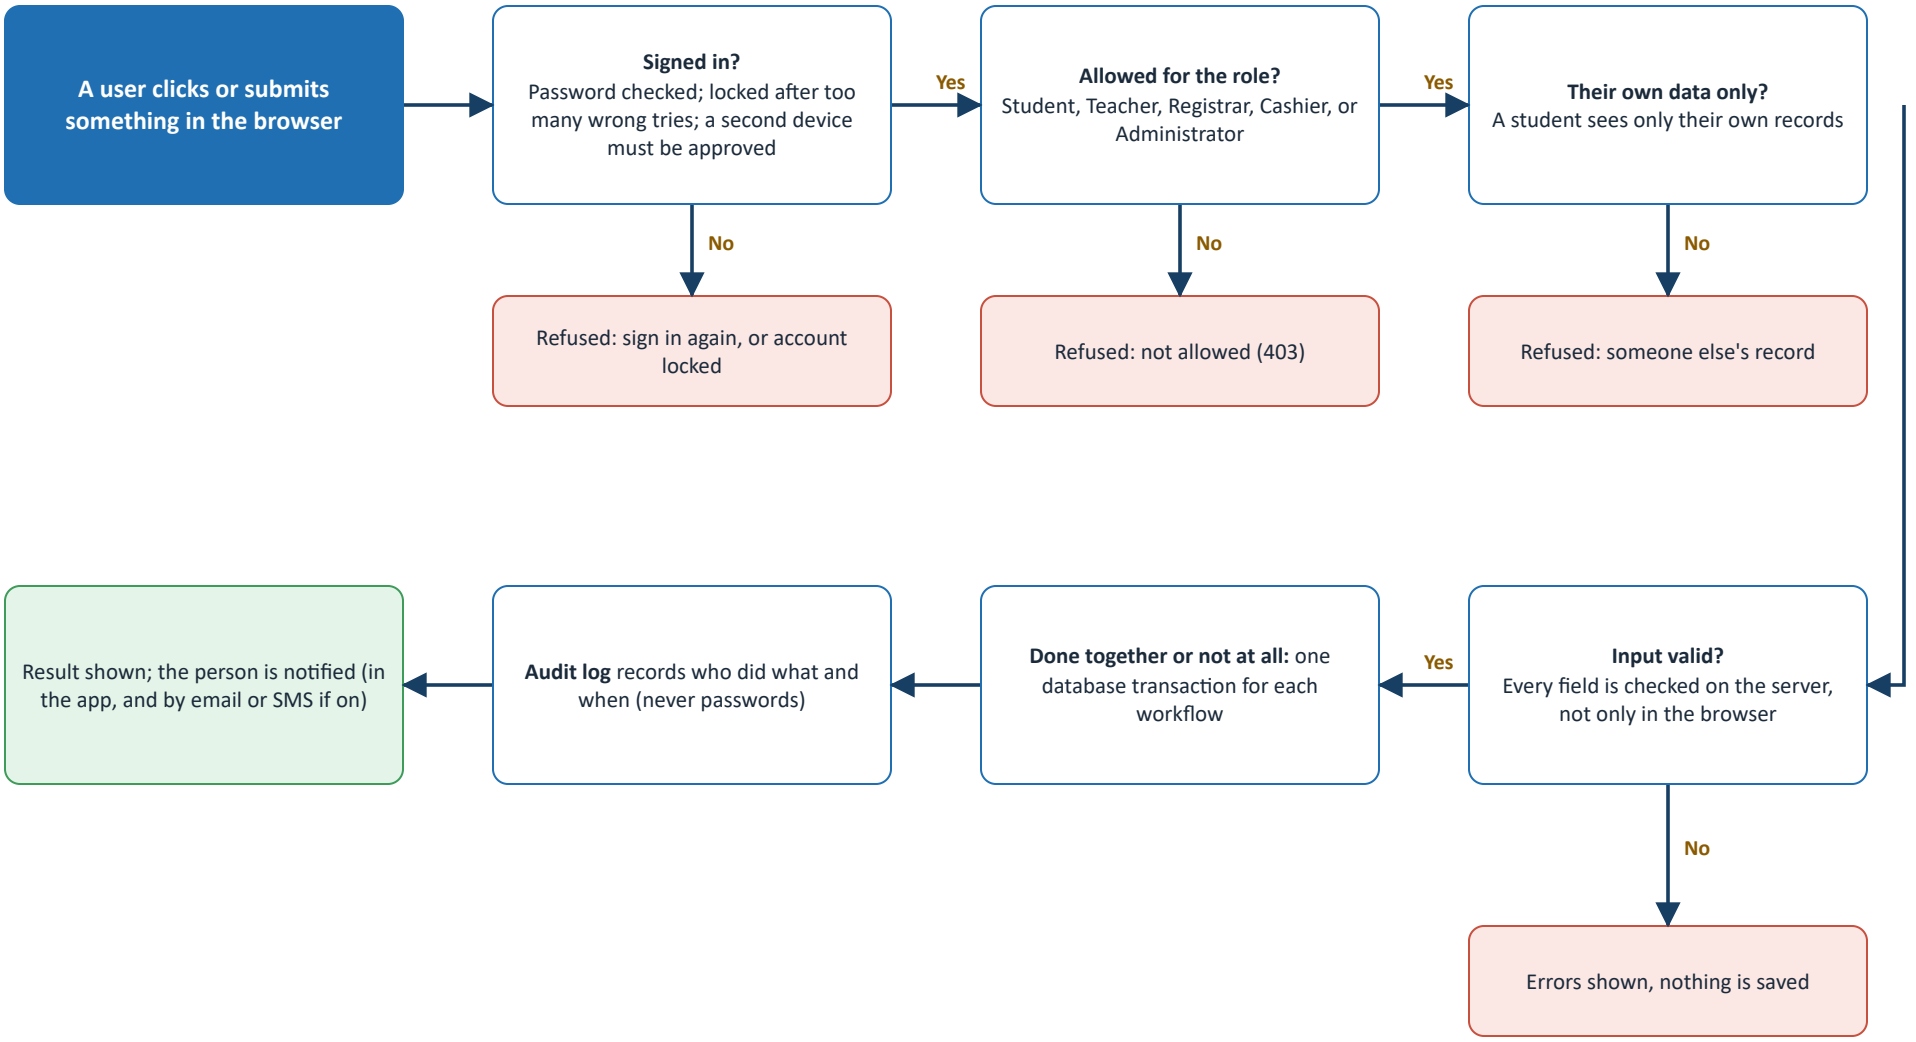

The public page shows only the minimum, and nothing at all for an unknown code.

Privacy: the QR holds only a web address with a random code, never a name or student number. No sign-in is needed to check a card, and the school can see how often an ID was checked.

8 How every request is checked before anything changes

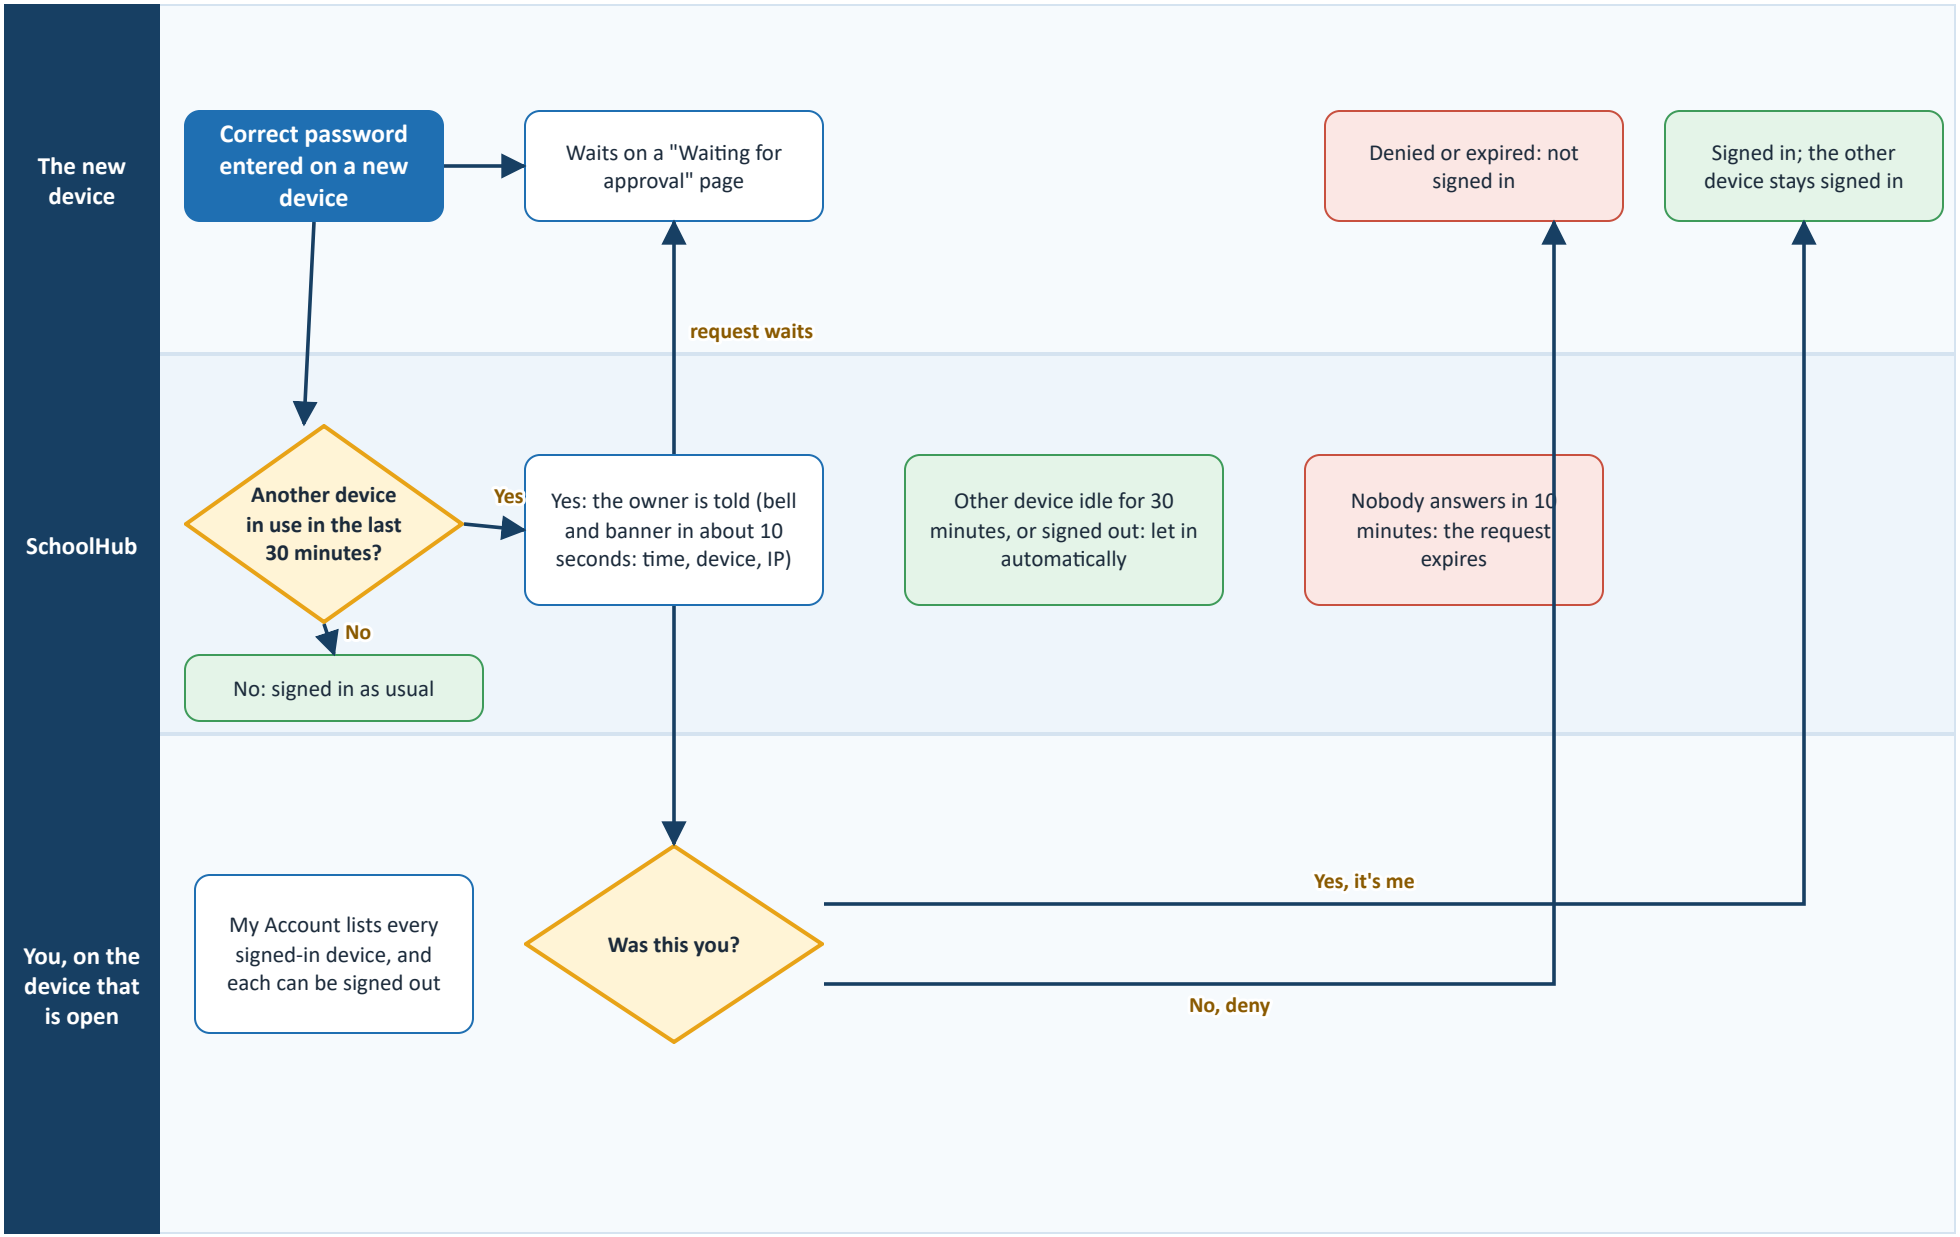

The same path for every screen, so a mistake or a bad actor cannot skip a step.

Enforced by the system itself: staff can do only what their role allows, and the day lock, school year, and payment policy are checked on the server, not only hidden on the screen.

9 When someone else uses your password, you are asked first

An account can be open on one device. A second sign-in waits until its owner says yes.

If a device is lost: the administrator can release the account, which signs it out everywhere. A single wrong password is not announced; when wrong passwords lock the account, the owner gets one notice. Every attempt, approval and denial is audited.
